Aster Vale Demonstration Clinic (fictional)

Urgent ambulatory assessment

Patient: Daniel M. (synthetic) | ID: SYN-001 | DOB: 1978-10-06

Encounter: ENC-001-06 | Source: DOC-001-06 | Type: emergency_note

Clinical time: 2026-07-08T09:40:00+03:00

Documented: 2026-07-08T12:45:00+03:00 | Author: Dr Nia Reed (fictional)

SYNTHETIC — NOT FOR CLINICAL USE

Presentation: Increasing cough, fatigue and breathlessness walking uphill. No breathlessness at rest, hemoptysis or fever. Reports ongoing lisinopril use through this morning.

Exam: Temperature 37.0 C, pulse 92/min, BP 130/80 mmHg, oxygen saturation 95% on air, weight 77.0 kg. Right basal crackles without wheeze.

Results: Blood tests and chest radiograph obtained; see linked reports.

Assessment: Persistent cough with weight loss and unresolved radiographic abnormality requires expedited respiratory assessment. ACE inhibitor contribution remains possible.

Plan: Stop lisinopril today; prescribe losartan for BP. Urgent respiratory referral and CT chest requested. Stable for ambulatory follow-up after assessment; explicit return precautions given. No final diagnosis assigned.
